Tushar Tulashidas Pawar	23211400055
Karan Naganath Bandgar	23211400039
Saurabh Balasaheb Zendage	24211400006

GUIDED BY

Mrs. Chakre A. S

**S.P.M. POLYTECHNIC, KUMATHE, SOLAPUR
(All programs accredited by NBA, New Delhi)
2025-2026**

S.P.M. POLYTECHNIC, KUMATHE, SOLAPUR
(All programs accredited by NBA, New Delhi)

C E R T I F I C A T E

This is to certify that the project report entitled “**AgriTrace**” was successfully completed by the student of sixth semester Diploma in Computer Engineering.

NAME OF STUDENT	ENROLLMENT NO.
Rahul Tukaram Shendkar	23211400032
Tushar Tulashidas Pawar	23211400055
Karan Naganath Bandgar	23211400039
Saurabh Balasaheb Zendage	24211400006

In partial fulfilment of the requirements for the award of Diploma in Computer Engineering and submitted to the Department of Computer Engineering of S.P.M. Polytechnic Kumathe, Solapur work carried out during the period for the academic year 2025-26 as per curriculum.

Mrs. Chakre A. S

Project Guide

Mr. Rashinkar V.V

HOD

External Examiner

Mrs. Rohini Chavan

Principal

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to our project guide Mrs. Chakre A. S for providing invaluable guidance, constant supervision, and encouragement throughout the development of this project.

We are deeply thankful to Mr. Rashinkar V.V, Head of the Department of Computer Engineering, for providing us with the necessary facilities and support.

We extend our heartfelt thanks to Mrs. Rohini Chavan, Principal of S.P.M. Polytechnic Kumathe, Solapur, for providing a conducive environment for research and development.

We also wish to acknowledge the support of our families and friends who have been a constant source of motivation.

Finally, we thank all the faculty members and staff of the Department of Computer Engineering for their cooperation and assistance.

PROJECT GROUP:

ABSTRACT

Agricultural waste management remains a critical environmental issue in India, with crop residue burning causing severe air pollution and soil degradation. AgriTrace is a comprehensive, full-stack web application designed to address this pressing issue by providing a digital ecosystem that connects farmers, collection agents, and recycling administrators. Built entirely on modern web technologies encompassing Next.js, Firebase, and Tailwind CSS, the platform facilitates a seamless transition from waste reporting to active recycling. The system enables farmers to list agricultural waste such as wheat stubble and rice residue, while collection agents efficiently manage the pickup-to-delivery logistics. Key innovative features include real-time geo-tracking using GPS services, an integrated and secure payment workflow via Razorpay, and a dynamic carbon credit tracking system that quantifies the environmental impact. By diverting waste from open burning toward productive recycling channels, AgriTrace fosters economic growth and significantly mitigates regional atmospheric pollution.

Keywords: Agricultural Waste, Web Application, Next.js, Firebase, Carbon Credits, Environmental Sustainability.

I. INTRODUCTION

India generates approximately 500 million tonnes of agricultural waste annually. A substantial portion of this waste, particularly in states like Punjab, Haryana, and Uttar Pradesh, is burned in open fields due to the lack of economically viable and logistically feasible alternatives. This practice results in severe air quality deterioration, with particulate matter reaching hazardous levels during winter seasons, escalating respiratory diseases across the Indo-Gangetic plains. Despite these recognized environmental and health hazards, farmers often resort to burning because they lack accessible and convenient alternatives for immediate waste disposal. There remains a profound disconnect between the farmers who consistently generate the waste and the recycling industries that possess the capacity to convert it into valuable secondary products like biofuel, compost, and animal feed. AgriTrace bridges this debilitating gap by providing a targeted digital platform that physically connects farmers with verified collection agents. The platform leverages modern web technologies and cloud infrastructure to

deliver a real-time, responsive, and highly scalable solution capable of orchestrating complex waste recovery logistics across diverse geographical boundaries. Incorporating robust role-based workflows, the platform ensures efficient management from the point of waste generation down to recycling completion.

II. METHODOLOGY

The system employs a sophisticated three-tier architecture developed using a robust modern tech stack to maintain flawless separation of concerns, improve system maintainability, and ensure near-instantaneous real-time synchronization.

Presentation Layer: The frontend utilizes Next.js pages coupled with reusable React components to deliver dedicated role-based interfaces for Farmer, Agent, and Admin users. The styling actively relies on Tailwind CSS and Radix UI to enforce responsive formatting that functions seamlessly on low-bandwidth rural mobile networks.

Application Layer: Backed by Next.js serverless API routes, the application layer inherently parses authentication checks, workflow transitions, push notifications, and high-security payment processing through the Razorpay SDK API. State management is efficiently synced globally.

Data Layer: Google Firebase operates as the backbone with Cloud Firestore storing high-frequency transactional data natively. Firebase Authentication handles zero-trust identity verification, and scalable Cloud Storage operates synchronously with Cloudinary to process and compress high-resolution image verifications detailing crop residue limits.

III. MODELING AND ANALYSIS

System design involved comprehensive structural modeling to systematically evaluate data velocity and isolate interaction layers. A robust user authentication strategy prohibits unauthorized access, guaranteeing agents only interact with successfully validated listings via AES-encrypted communication

A. Use Case Diagram

The Use Case configuration structures the isolated pathways strictly linking Farmers, Agents, and Administrators to their atomic capabilities within the network.

Figure 1: System Use Case Diagram outlining role-based atomic capabilities.

B. Data Flow Diagram

The Level 0 Data Flow Diagram isolates the central processing capabilities routing payloads through the AgriTrace system, directly interacting with Razorpay and Firestore gateways securely.

Figure 2: Level 0 Data Flow Diagram illustrating request lifecycles.

C. Tier Architecture

Finally, the three-tier framework strictly maintains robust API logic routing connecting presentation components down to data management dynamically.

Figure 3: Three-Tier System Stack Visualization

IV. RESULTS AND DISCUSSION

The deployed AgriTrace application successfully orchestrates the entire waste tracking lifecycle in real-time.

Performance testing actively indicated that the Firestore-backed architecture sustained optimal page load times under diverse conditions. Visual implementation was directly verified against standard compliance parameters.

Figure 4: AgriTrace Complete Landing Interface

Figure 5: Farmer Dashboard detailing active waste listings and carbon offset accumulations.

The seamless integration of Razorpay ensured that farmers securely received instant payment directly upon verified waste delivery updates by the agents, aggressively boosting platform trust. Furthermore, the localized Gamified Carbon Tracking component effectively visualized the environmental impact—logging equivalent metric CO₂ savings derived actively from the sustainably diverted agricultural residue

V. CONCLUSION

mobile-optimized frontends, the platform uniquely bridges the logistical disconnect between waste-generating farmers and recycling facilities. The platform inherently succeeds in curtailing severe atmospheric pollution while concurrently unlocking crucial secondary economic value from traditionally discarded biomass. Subsequent versions aim to deploy expansive multi-language support (Hindi, Marathi, Punjabi) enabling widespread adoption across diverse linguistic communities, coupled with IoT-assisted scale integrations to heavily automate collection weight verifications natively at pickup hubs.

ACKNOWLEDGEMENTS

We would like to express our deepest gratitude to our project guide Mrs. S. A. GAIKWAD for her invaluable guidance, encouragement, and continuous support throughout this research work. We also extend our thanks to the faculty members of the Computer Engineering Department at S.P.M Polytechnic Kumathe for heavily bolstering our technical capabilities and guiding the platform's infrastructural development..
